CONVAC slide valve

The CONVAC control and display panel is the operator's primary source of dredge performance information. It should be located where the operator can see the displays and adjust the vacuum setpoint as required to maintain constant velocity. CONVAC prevents the vacuum from rising above the setpoint and assures full, uninterrupted production. The position display keeps the operator informed to the position of the slide valve from closed to 100% open. The CONVAC is a big step towards automation.
