

If you have a rotary cutter dredge working in a deposit with clay seams and near-size material these pictures may be familiar. On the left is a typical sand & gravel screening basket, on the right is a typical bladed basket. Both are plugged with clay and near-size material that must be manually removed. Both will plug again. The solution to the problem is shown below: The CLAYMATOR Universal Cutter from Twinkle Co.

The unique design of the CLAYMATOR “screens and cleans” as it rotates. The openings are designed and arranged to reject oversize material and scrub away clay. This allows for continuous, uninterrupted and profitable operation. The CLAYMATOR cutter has individually replaceable teeth and is bi-directional.
