# CLAYMATOR HEAVY METAL

The surface protection on a standard Claymator basket is a pattern of wire-weld hardfacing. For severe duty applications the hardfacing may not provide adequate service life and a more robust type of surface protection is required. The severe duty solution is CLAYMATOR Heavy Metal that covers the surface with carbide buttons.

The buttons provide a two-stage method of surface protection. One, the carbide button is extremely wear resistant. Two, the space between the buttons packs with material that shields the surface of the basket.
